Business Context

Producer Information & Local Benefits

Many competitors in the local farming and food producing industry fail to clearly provide detailed information in their digital solution. They lack transparency about their producers, as well as the methods they use to produce, and they also fail to bring up all the benefits of buying locally. This results in customers being hesitant, the connection and trust with the customer reduces, abandoned shopping carts or even preferring to shop from competitors. Therefore, the client, Greenfield Local Hub has requested for the digital solution to include producer profiles and all the important information needed. This is for customers to have a more in-depth idea of the local hub and what they strive for, but also to convey a message to society on how we must support the locals to boost the economy, so the money stays within the community. By buying locally, it supports small businesses and new jobs are created, it also helps the environment by reducing transport emissions. Including this information in the solution, will encourage customers to buy locally and help small businesses, it will also enhance the user experience and lead to higher revenue. Greenfield Local Hub will then become credible in the community, securing a strong position in the industry.

Product Listings with Pricing & Availability

Greenfield Local Hub has requested that the solution provides clear product listings with transparent pricing and availability. For an industry standard solution it must comply with all the consumer legislations, the solution must be clear to all consumers. Customers rely heavily on this information when purchasing online, and without detailed listings that are accurate, they might become uncertain of purchasing or even feel deceived after having other expectations. By providing organised product listings with accurate pricing and availability, the solution will improve the user experience leading to satisfied customers, increased sales. This makes the business financially grow which then helps them expand their connections in the community that could lead to other positive possibilities.

Order Placement (Collection or Delivery)

The client has requested that the solution allows customers to place order for collection or delivery. This is a feature most competitors in this field fails to include, which could be disappointing for customers. Customers value flexibility and convenience when ordering online and including both the collection and delivery option will be something unique to the business that separates Greenfield Local Hub from most competitors. Without this feature, the business would lose on potential sales and the position on the market that could make them stick out. By including the feature in the digital solution, it will simplify the purchasing process and provide a seamless user experience. Lastly, this supports consistent business growth since the accessibility of the service improves.

Customer Account & Order History

Greenfield Local Hub has requested that the solution allows customers to create an account, which allows them to also manage their details and view their order history. Customers expect to be able

to manage and update their account details, in order to make their information successfully up to date. They also appreciate the ability to find their past purchases and reorder items that they liked, and without these functionalities they may feel frustrated or disappointed. This could lead to a loss of customer trust and loyalty, which can result in negative reviews, less sales and even giving competitors with these features an advantage. By allowing customers to manage their accounts and track their orders easily, the digital solution will offer a more personalised and efficient user experience. This will result in repeated orders, but also making the jobs of staff easier, spending less time on updating users accounts and finding their past orders.

Producer Stock & Product Management Dashboard

The client wants the solution to include a producer dashboard that makes producers able to manage their stock levels, update product detail and view orders. A professional, industry standard solution should allow producers to efficiently update their available products and quantities. Without this valuable functionality, stock information may have a higher chance of becoming inaccurate or outdated, this could eventually lead to customers ordering products that are in reality not available. This will cause frustration and trouble keeping things running smoothly. By providing a producer management dashboard personalised for each producer, updating the stock, prices, and product details would be easy and more efficient for producers. This will contribute to accurate listings, and a maintained reliable shopping experience for customers.

Order Management, Scheduling & Tracking

Greenfield Local Hub has conducted market research with existing customers and now are requesting that the solution allows customers to manage orders, schedule collections or deliveries, and track their orders. For customers, being well informed about their orders makes them relieved, and without this functionality they may feel worried and uncertain about the progress of their orders. This could lead to more work for the staff because of unnecessary enquiries from customers, or less trust and confidence in the service. By making it possible for users to manage their orders, track scheduled collections or deliveries, the solution will make ordering more straightforward and convenient for customers. This will result in improved customer satisfaction, and a more consistent and organised shopping experience.

Loyalty Scheme & Special Offers

The market research the client conducted suggested that the solution should include a loyalty scheme that provides discounts and special offers. With the goal of motivating regular customers to keep purchasing and using the service, this feature will be beneficial for the business. The loyalty scheme and promotional offers will encourage customers to make frequent purchases and discover different products. By introducing this feature it will help increasing customer retention, support consistent revenue for the business and strengthen customer loyalty.

Accessibility Features

Greenfield Local Hub suggested that the solution should include accessibility features that support a wide range of users. Majority of the competitors fail to provide accessibility features such as high

contrast mode, larger text, dark mode, text-to-speech, etc. This could lead to users struggling to navigate through the solution due to disabilities or other difficulties. Therefore, by including accessibility features the solution will make sure to comply with the WCAG and Equality Act so that more users can easily access the platform and result in more satisfied users. This will enhance the overall user experience, show inclusivity and help the business reach all types of users. It will then increase the possibility of the business growing in the community, they will have a better reputation and become one of the top competitors in the market.

Project Aim

These are the essential requirements that the client would like to be developed and included in the digital solution:

- provide information about the producers, their methods and the benefits of buying locally
- allow customers to view products with transparent pricing and availability
- allow customers to place orders for collection or delivery
- allow customers to manage their account and view order history
- provide a dashboard to enable producers to manage stock levels, update product details and view orders.
- order management, scheduling and tracking features
- a loyalty scheme that provides discounts and special offers
- accessibility features to support a wide range of users

Functional Requirements

Personas:

- **Tom** is a local farmer that sells his products at Greenfield Local Hub, he needs a simple producer dashboard that allows him to update his stock levels, update his products details, and view all his orders while working on the farm.

- **Merinda** is in her late 60s and has trouble walking so she prefers to place orders for delivery. Unfortunately, she has weak vision so she needs clear, visible pricing and product information. Therefore, accessibility features are essential for her.

- **Jack** is a customer in his 20s that regularly buys fresh local products for his family. As a regular customer he would appreciate a loyalty scheme that occasionally gives him discounts and special offers.

Functional Requirement	User Story	User Acceptance Criteria	Justification
Register	As Tom I want to register an account so that I can sell my products online and expand my business.	• Find the homepage • Select register from the navigation • Navigate to register page • Enter a valid email address • Enter a strong password • Re-enter the password • Correct any invalid inputs • Submit registration form • Receive confirmation message • Be redirected to log in page	For Tom registering an account is important for him since he wants to be able to sell his products in the digital solution. A specialised producer account is needed since he will be selling his products through GLH. The features and functionality he will have access to, are different compared to a customer's features. Registering is important so that all the data he adds or removes is saved to a personalised account that he can access again whenever he wants.
Register	As Merinda I want to register an account so that I can place digital orders for delivery.	• Find the homepage • Select register from the navigation • Navigate to register page • Enter a valid email address • Enter a strong password • Re-enter the password • Correct any invalid inputs • Submit registration form • Receive confirmation message	Having an account for Merinda is necessary, she wants to place and manage her orders easily. To place an order, an account is needed so that personalised data can be stored. Without an account, Merinda will be restricted from making a purchase.

		• Be redirected to log in page	
Register	As Jack I want to register an account so that I can access all the features of the website.	• Find the homepage • Select register from the navigation • Navigate to register page • Enter a valid email address • Enter a strong password • Re-enter the password • Correct any invalid inputs • Submit registration form • Receive confirmation message • Be redirected to log in page	Jack wants to register because he wants to be able to place orders, get loyalty points, view his orders and track them. An account is very important to any user, it makes their user experience much improved.
Log In	As Tom I want to log in to my account so that I can access the producer dashboard and manage my products, view orders and edit the stock levels.	• Find the homepage • Select Log in from the navigation bar • Enter valid credentials • Correct any invalid inputs • Log in successfully	Tom needs to be able to log in, so he could access his producer dashboard and manage his account. Without logging in he will not have access to his personalised data stored in the system.
Log In	As Merinda I want to log in to my account so that I can view my order history and reorder the same order.	• Find the homepage • Select Log in from the navigation bar • Enter valid credentials • Correct any invalid inputs • Log in successfully	To be able to view previous orders, Merinda needs to log in to her account that she used to make purchases. Logging in makes it possible for her to access the saved data of previous sessions since it is linked to her account.
Log In	As Jack I want to log in to my account so that I can access my personalised saved data.	• Find the homepage • Select Log in from the navigation bar • Enter valid credentials • Correct any invalid inputs • Log in successfully	In order for Jack to view his saved up loyalty points, view his previous orders, place orders and track them he will need to log in to his existing account. The saved data from previous sessions are only accessible when logged in.
Account Information	As Jack I want to view my account information so that I can change the delivery address.	• Find the homepage • Make sure you are logged in • Navigate to account icon • View current profile details • Select edit profile option	For Jack to update his account information, he will have to be logged in to his account. He will then be able to access account information, there he could update the delivery address. This feature is needed for

		• Update delivery address • Validate updated information • Save changes • Receive confirmation message	people like Jack, that might have moved out from the saved address, and he would like to update it. Being able to update personal information is a right mentioned in the Data Protection Act, therefore the solution must comply with the legislation.
Account Information	As Tom I want to view my account information so that I can check my personal information is accurate.	• Find the homepage • Make sure you are logged in • Navigate to account icon • View current profile details	Tom wants to view his account information to make sure personal details are correct. If any details are incorrect, issues could happen such as delivery mistakes.
Account Information	As Merinda I want to view my account information so that I can change my email.	• Find the homepage • Make sure you are logged in • Navigate to account icon • View current profile details • Select edit profile option • Update delivery address • Validate updated information • Save changes • Receive confirmation message	Merinda has made a new email address and wants to replace her current accounts email to the new one. She wants to view the account information so she can update it to the new email. Viewing account information is useful since she can update the details all by herself, instead of having to call support and stay online for a simple email update. That is why this feature is efficient and saves both customer and the staffs time.
Order History	As Merinda I want to view my order history so that I can reorder products that I liked.	• Find the homepage • Make sure you are logged in • Navigate to account icon • Find order history • Click re-order • Previous order products sent to the shopping cart • Be redirected to shopping cart	Viewing order history lets Merinda reorder previous products she liked quickly. This feature saves her time and convenience when shopping regularly. This will benefit the business by encouraging more sales meaning increased profit.
Order History	As Jack I want to view my order history so that I can make sure the products I got delivered	• Find the homepage • Make sure you are logged in • Navigate to account icon • Find order history • View latest order	Jack has faced delivery problems before from many companies, to reduce the risk of facing issues like these, he could use the order history as proof of his

	are the exact same as ordered.	• Check all the items are correct	order. He could check if the products he received match the order or not. This way Jack can identify any mistakes easily, this shows that the solution looks only for the satisfaction of the customer.
Product listings with pricing and availability	As Merinda I want to view products and their availability so that I can make an informed purchase.	• Access the homepage • Navigate to the shop page in the navbar • Select product you want to view • View product listing details, pricing and availability	Merinda has some allergies, she always needs to view the description of products to make sure she avoids any allergens. Therefore, to make an informed purchase, she needs the feature of viewing product listings otherwise her life could be in danger if she purchases harmful products. The solution must comply with the food information regulations, to prevent this from happening.
Product listings with pricing and availability	As Jack I want to view products so that I can find out the method of production.	• Access the homepage • Navigate to the shop page in the navbar • Select product you want to view • View product listing details, pricing and availability	Jack loves following a healthy style of living, so he goes only for organic products from local producers. But when purchasing he likes to first know what method of production is used. Without that information he will be hesitating to buy the products, the business could lose potential sales if production methods are not specified.
Order Placement, collection or delivery	As Merinda I want to place an order for delivery so that I do not have to visit the local hub.	• Access the homepage • Navigate to the shop • Add items to shopping cart • Select delivery • Enter details • Confirm order	This feature is convenient and makes it accessible for Merinda since she has trouble walking because of her age. Without delivery options, customers might choose other services that offer delivery options.
Order Placement, collection or delivery	As Jack I want to place an order for collection so that I can quickly take my order	• Access the homepage • Navigate to the shop • Add items to shopping cart • Select collection • Enter details	This feature will be useful for Jack as it allows flexibility, he can avoid delivery waiting times and collect the order at a time that suits him. Providing

	when coming back from work.	• Confirm order	both delivery and collection makes sure that the solution meets different customer needs, improving their satisfaction.
Producer information and local benefits	As Jack I want to view producer information and local benefits so that I can understand where the products come from and support local producers.	• Navigate to producer page • Select a producer • View producer details • View production methods • View local benefits	Without the information, Jack might feel uncertain about purchasing, which could lead to lost sales for Greenfield Local Hub. This information develops trust between customer and producers and encourages users to support local businesses. This will increase engagement and revenue for the business.
Producer stock	As Tom I want to manage the products stock level so that I can update the stock to an accurate number.	• Make sure to login • Navigate to producer dashboard • Select the product management section • Click edit on the selected product • Update stock if needed • Save changes	Tom needs to update stock levels, if not customers might order products that are not available, which will lead to cancellation of the order and dissatisfaction. This feature helps keeping reliability in the system and makes sure that customers get the correct information before buying.
Product Management Dashboard	As Tom I want to update product details so that I can increase the price.	• Make sure to login • Navigate to producer dashboard • Select the product management section • Click edit on the selected product • Update the product details • Save changes	Tom wants to update the prices of his products because of supply costs. To do so he needs access to the product management section in the dashboard as a producer. Without this, Tom will not be profiting anymore if prices are not changed, therefore this functionality is essential for a producer.
Order Management	As Tom I want to view customer orders so that I can manage their status.	• Make sure to login • Navigate to producer dashboard • Select the order management section • View all customer orders • Change status if needed • Save changes	Tom needs to be able to view customer orders so that he can manage their status. This feature helps organising orders and quickly sendoff orders without delay. This will enhance the customer experience.
Loyalty Scheme	As Jack I want to get discounts	• Successfully make an order	This feature encourages Jack to keep purchasing from the

	and special offers after purchasing so that I can save money.	• Navigate to account • Select My Loyalty section • View loyalty points received from purchase • Redeem offers with loyalty points	site because of the rewards. The loyalty scheme will help increase customer retention and make users feel compensated for their activity, this will benefit the business through increased sales.
Loyalty Scheme	As Merinda I want to get discounts and special offers after purchasing so that I can continue to buy from the local producers.	• Successfully make an order • Navigate to account • Select My Loyalty section • View loyalty points received from purchase • Redeem offers with loyalty points	This feature motivates Merinda to return to the platform regularly. It develops customer loyalty and promotes repeat purchases which helps the business grow.
Accessibility Features	As Merinda I want to have access to accessibility features so that I can increase the text size for easier readability.	• Find accessibility header above navigation bar • Hover on button for dropdown menu • Choose increase text size	Merinda has visual difficulties and this feature helps her navigate through the platform easier and it makes her feel more included. She will appreciate the business more making her become a loyal customer.
Accessibility Features	As Jack I want to have access to accessibility features so that I can turn the website into dark mode.	• Find accessibility header above navigation bar • Hover on button for dropdown menu • Choose dark mode	Turning the website to dark mode helps reduce eye strain, especially when using the website for long periods. Adding features like these makes the platform more comfortable to use for different types of users.

Non-Functional Requirements

Performance		
Non-Functional Requirement	**Justification**	**KPI**
Latency of the solution	The solution must have consistent low latency speed, in order for the users to have a seamless experience without any frustration. The digital solution should maintain fast service especially for simple activities. If not, then the user might choose another service instead.	• The average page response time should be under 2 seconds. • At least 95% of requests should respond within 3 seconds. • The server must fully process under 1 second. • The solutions latency must remain stable during peak time.
Industry standard load time	Fast load time is a common convention that the solution must have in order to compete in the market. Users do not appreciate platform with slow load time, making them find other platforms to purchase from.	• Homepage should load in under 2 seconds. • The shop and product pages should load in under 3 seconds.
Fast ordering processing	Users expect the digital solution to be quick to process orders so that customers can make their purchases without delay. Slow processing time could make the customer anxious when making purchases and even cause them to abandon orders and lose trust in the business.	• Order confirmation message should be generated within 2 seconds. • Payment processing should be completed within 3 seconds. • 99% of orders should be processed successfully without errors. • The system must be able to handle multiple orders at the same time without delay.
Efficient filtering products performance	The site must provide fast and correct product filtering so customers can easily find what they want. If the filters are slow and give the wrong results, the user experience will be poor and low reviews will be given.	• Product filters should respond in under 1 second. • 95% of filter requests should be processed within 1.5 seconds. • Search/filter accuracy should be above 98%.

Security		
Non-Functional Requirement	**Justification**	**KPI**

Authorisation	Authorisation must be implemented to make sure only the right users can access some areas of the solution. Only the producers and staff should be able to manage their products and stock, and customers should only be allowed to handle their accounts and orders.	• 100% of users must be logged in before being able to access restricted pages. • Role-based access should be applied to all admin/producer features. • Authorisation checks should be completed in under 1 second. • 0 unauthorised role changes allowed in the system.
Unauthorised access prevention	When a user tries to access restricted pages without logging in to an account, they will be automatically redirected to the log in page. This will prevent unauthorised access from corrupting the solution and the data in it. s	• 100% of login attempts must be validated by the system. • All restricted pages should be blocked for users that are not logged in.
Data protection	The site will store personal information such as customer names, email addresses, and delivery details therefore data protection is important. This information must be stored securely so it can't be stolen or misused. Protecting this data helps keep users safe and makes sure the solution follows data protection laws.	• All user passwords should be stored using hashing. • There should be no unencrypted personal data stored in the database. • The access to personal data should be restricted to authorised users only.
Two-factor authentication	Two-factor authentication adds an extra layer of security when users log in. Even if someone knows a user's password, they should still need a second code to access the account. This helps protect accounts from being hacked and keep user data safer.	• 95% of 2FA verifications should be completed within 2 seconds. • 100% of two-factor authentication codes should be sent securely via authenticator app.

Scalability		
Non-Functional Requirement	**Justification**	**KPI**
Order processing capacity	The platform must be able to handle a high number of orders in efficient speed during busy periods. Users should not experience any delays when ordering. Having a high order processing	• The system should be able to process over 100 orders per minute. • 95% of orders should be processed within 5 seconds.

	capacity makes sure the system functions smoothly, it makes customers satisfied and eventually supports business growth.	• The success rate for order processing should be 99%.
Load tolerance	Handling high number of users at the same time without crashing is important for the solution. If it can't handle many users, then the website might stop working. This would stop customers from placing any orders, and the trust for the platform reduces.	• There should be no system crashes during high traffic periods. • Within 30 seconds the system should recover from overload.
Data volume scalability	The platform will constantly expand when new products are added, new producers and when users register. The system must handle increasing amount of data without slowing down and affecting performance. This is important to support long term use and reliability.	• Automatic database indexing should support fast data retrieval. • Performance should be maintained when database size grows by 50%.
Simultaneous producer access	Multiple producers and admins should be able to manage their products at the same time without any errors. If the solution can't handle this, data might be lost or overwritten causing incorrect product information and failing to comply with the food information regulation.	• System should support over 50 producers/admins updating products at the same time. • 95% of product updates should complete within 2 seconds. • There should be no data conflicts during edits at the same time. • 100% of updates should be correctly saved in the database.

Capacity		
Non-Functional Requirement	**Justification**	**KPI**
Multiuser capacity	Platform must successfully maintain performance when multiple users are accessing it at the same time. If the system fails because of the capacity, the users will feel frustrated since they can't access their accounts and make purchases. The business will lose	• There should be no crashes when multiple users access the system. • Login requests should be processed within 2 seconds.

	customers if it can't remain stable.	
Concurrency	The system must be able to handle multiple actions happening simultaneously. Like producers updating stock levels while a user is making a purchase at the same time.	• Multiple actions at the same time should be handled without errors by the system. • There should be no data conflicts during simultaneous transactions.
Responsiveness	When users click buttons or submitting forms, the platform must respond quickly for an industry standard system. Users could otherwise think the platform is not working making them find other services leading to loss of customers.	• The solution should respond to user actions within 2 seconds. • Buttons and forms react within 1 second, • The mobile and desktop response times remain consistent.
Data capacity	The system must be able to handle a large amount of data, like a lot of products in the page. The solution must still have good performance even with a lot of data saved and uploaded.	• The shop should support up to 1000 products • Solution must maintain performance when large datasets are uploaded

Reliability		
Non-Functional Requirement	**Justification**	**KPI**
Error handling	Error handling must be properly handled by the digital solution, it is important to show clear messages to users when an error happens. Without any proper error handling, users will be confused why the platform is not working which will lead to contacting the support team. This will only add more work to staff and frustration for users.	• All of system errors must generate a clear error message for users • Error message returned within 2 seconds
System recovery	The solution must be able to recover quickly from a system failure without loosing any data. If data can't be recovered after a system failure, users orders, or account information could be lost. Users will not trust the platform.	• After a system failure there should not be any permanent data loss. • System restarts and recovers within 5 minutes after a crash.

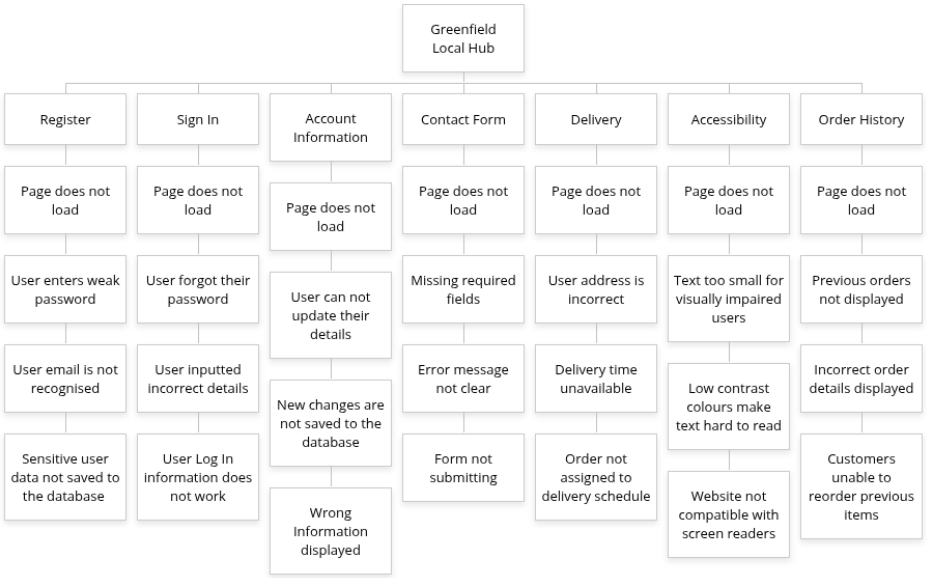
Backups	Automatic backups must be consistently done so that if any crashes or system failure happens, all the data is secure and safe and could be recovered quick. This helps reduce the risk of permanent data loss and makes sure that the business could continue run smoothly while keeping customer trust.	• Backup success rate at least 99%. • Automatic backups must be performed.
Order accuracy	Customer orders must be stored correctly within the system, without any errors or duplications. If incorrect orders are created, it will cause extra work for the producers.	• There should not be any duplicated orders generated by the system. • All orders logged with date, time and User Id.

Usability		
Non-Functional Requirement	**Justification**	**KPI**
Mobile responsiveness	The platform should be able to work on different screen sizes such as desktops, mobile phones and tablets. Key elements must successfully adjust to the screen size of the device to make sure the user have the best experience.	• Solution layout should adapt to different screen sizes (mobile, desktop, etc.) • Under 3 seconds mobile load time.
Consistent layout	The design of the digital solution must have a consistent layout across all pages, like fonts, colours and structure of the design. If the design is changes between pages, it may confuse some of the users and it could lead to a worse user experience. A consistent layout will make sure the website is usable.	• The fonts and colours should stay consistent across all pages. • All the pages should follow the same design template.
Efficient tasks	Users must be able to complete tasks quickly and easily in the platform. If users experience too many steps just to perform a simple action, they could be frustrated and looking to find another service. Reducing the amount of clicks and making	• There should be minimal clicks required to access key features. • Users can make a purchase under 5 steps. • Product search results show within 2 seconds.

	processes fast, will only make sure the user experience is great.	
Intuitive navigation	The navigation of the website must me easy to use to all types of users. They should find what they are looking for easily with minimal number of clicks. Having a simple and well structured navigation bar and footer will improve the usability of the system.	• Navigation menu is accessible from every page. • Categories are clearly classed for easy understanding

Accessibility		
Non-Functional Requirement	**Justification**	**KPI**
Text resizing	The digital solution should be able to increase text size without breaking its layout. This will be beneficial to users with sight problems, and it will improve accessibility. This will make sure the solution could be accessible to an even larger audience.	• The users should be able to increase text size without breaking layout. • No content should overlap when text is resized.
Readable fonts	The fonts used in the solution must be easy to read and clear to all users. If fonts are hard to read, user might struggle to use the system and potential sales could be lost. Web safe fonts will improve readability and user experience.	• All fonts in the solution are clear and web safe. • The font size is at least 16px in the solution.
Screen reader compatibility	Users with visual impairments should be able to navigate through the website easily, and that is by allowing the solution to work well with screen readers. Screen readers should be able to access navigation links and key elements to ensure the user can use the system well.	• All the navigation links in the navbar should be accessible by screen readers. • 95% of pages pass screen reader accessibility checks.
Colour contrast	Content must be easy to read, therefore colour contrast between text and background must be clear. Without colour contrast users might not be able to read important information, this is especially important for users with visual impairments.	• 100% of important text should be clearly visible against background. • Links and buttons have clear visual contrast.

Hierarchy Diagram



UI Considerations

The digital solution for Greenfield Local Hub must be developed in a professional way for it to represent the business well. The solution must be usable, visually appealing and industry standard. For the user to have a seamless experience the user interface must be modern and clean without too much information on the pages which could lead to confused users. For the designing phase I have considered some key aspects which are the colour scheme, images and fonts.

First, the colour scheme I am planning to use is clean, industry standard and is connected to nature. The main colours I am using are white, dark green and brown. White is a bright and welcoming colour creating a sense of cleanliness and professionalism, it helps making key elements in the pages easy to read and stand out. The dark green I am planning to use will add a sense of freshness, and a connection to organic, high-quality products. It will be mainly used on key elements to draw the users-attention such as the register button, “shop now” button or the add to basket and in this way, it will guide the users through the ordering process. The dark green I am planning to use is called English Green, and I believe this dark forest green accent colour will give the website a luxury feeling grabbing the attention of the users. The simple brown colour will be a great addition that represents the local farmers and food producers as well. The brown will be used for badges and certain call outs across the page.

The fonts I am planning to use on my visual design are mainly sans-serif fonts, and I am mostly using “DM sans” that is a recognised font widely available in google fonts. People come across it daily on popular websites, which creates a feeling of familiarity. I plan to use a serif font like “Playfair Display” for headings so the user can easily find important sections.

Finally for the images I plan to use, they will be coming from trustworthy sources, and they will be relevant to the theme of the digital solution. It will help with maintaining the consistency throughout the pages and meet the target audience. The images will be copyright free and made sure they do not violate any laws

Security Considerations & Risk Mitigation

Risk Matrix

Impact				
High	R4	R3	R2	R1
Significant	R8	R7	R6	R5
Moderate	R12	R11	R10	R9
Low	R16	R15	R14	R13
	Low	Moderate	Significant	High
	Probability			

Risk Descriptions

Risk	Descriptions
R1	Producers forgetting to update stock levels.
R2	The system crashes during busy ordering periods.
R3	Orders are scheduled incorrectly.
R4	Failure in the server side or data loss.
R5	Producers enter wrong product information.
R6	Customers enter wrong delivery details.
R7	The order tracking information is not updated.
R8	Unauthorised access to accounts.
R9	Customers forget their log in details.
R10	The product availability is not updated on time.
R11	Images of products fail to load.
R12	The loyalty system applies wrong discounts or points.
R13	Users struggling to find information.
R14	Spelling and formatting mistakes.
R15	Users failing to use accessibility features.
R16	Brief website slowdown

Risk	Mitigation Strategy	Justification
R1	When stock levels are low the system could then notify the producer to update. Another strategy could be notifying the producer when stock levels have not been updated for a certain time as well.	This will reduce the impact of the risk because wrong listings could be corrected quickly. It stops customers from ordering products that are actually out of stock, and this will help maintain customer satisfaction and compliance with the consumer protection from unfair trading regulations.
R2	Proper error handling, logging and request validation could be implemented in the solution. If the digital solution fails, an	Error logging lets developers quickly identify and fix the problem, while the page stops users from seeing technical crash messages. This reduces

	error page could be shown while the issue is being logged for developers to fix.	the impact because users will not lose their order information if an error occurs.
R3	The solution could allow customers and producers to edit or reschedule orders after they have been placed. Also, when errors are detected, delivery or collection times could then be manually adjusted by staff.	Without cancelling the entire order, and fixing the mistakes instead, the impact will be reduced. This leads to customers still receiving their products and the business avoids losing sales.
R4	The database should be regularly backed up and stored securely. This way if the data is lost or the server fails, the solution can restore the most recent backup.	Regular backups make sure that important data such as orders, accounts, and product listings can be recovered. It helps avoid disruptions and stops important information from being permanently lost.
R5	The system should let producers or staff to edit product listings at any time and update wrong details. If an order is affected by incorrect information, customers should be notified.	This will reduce the impact since wrong information could be corrected quickly. Customers will be then informed and offered alternatives or even refunds.
R6	Users could contact the staff or producers to edit their delivery details after placing an order.	This reduces the impact because wrong delivery details could be fixed before the order is delivered. It avoids wasted deliveries and helps make sure customers will still receive their orders.

Legal and Regulatory Guidelines

Legislation	Application
General Data Protection Regulation / Data Protection Act 2018	The solution will make sure to comply with the General Data Protection Regulation and Data Protection Act by making sure that customer information that is saved such as names, email addresses, delivery details, and account data are stored securely. The data will be collected lawfully and only used for its intended purpose only. Greenfield Local Hub must tell their customers how their data is used with a clear privacy policy. Failing to comply with these regulations could lead to data breaches, loss of customer trust, reputational loss and legal consequences.
Consumer Rights Act 2015	The Consumer Rights Act makes sure that customers get the products they purchased as the seller described and of reasonable quality. The solution will follow this legislation by accurately describing the items in the product listings, and that also includes the price, quantity and condition. The customers have the right to request a refund or replacement if they received incorrect or bad quality products. For the business to be deemed trustworthy and have a great reputation, this legislation is important to comply with.
Consumer Protection from Unfair Trading Regulations 2008	The Protection from Unfair Trading Regulations are responsible for when businesses wants to promote or sell their products, it makes sure that they will not use deceptive or misleading methods to get their products sold. Therefore, the solution must ensure that all product descriptions, prices, availability information, and special offers, must be accurate and true. In order to protect customers and maintain Greenfield Local Hubs credibility, the marketing and product information must be honest and transparent.
Electronic Commerce (EC Directive) Regulations 2002	Since this platform will be a digital solution that sell products or services online, it must comply with the Electronic Commerce (EC Directive) Regulations. Important business information must be displayed such as company contact details, terms and conditions, pricing, ordering processes. A confirmation message must be sent to the customer when an order has been placed. To ensure transparency in online transactions Greenfield Local Hub must comply with these regulations successfully.
Equality Act 2010 & Accessibility Standards WCAG	The Equality Act requires businesses to make sure that people with disabilities can access services successfully. In order for business to meet this they must follow the accessibility guidelines such as Web

	Content Accessibility Guidelines (WCAG). Features that help make sure that all users can access and use the solution effectively are readable text, clear navigation and compatibility with screen readers. Including accessibility features will support inclusivity and makes sure that the business does not unintentionally exclude certain users. The solution will include high contrast mode, dark mode, text size increase/decrease to ensure readability. The solution will also be compatible with screen readers and included as an accessibility feature.
General Food Law Regulation (EC) No 178/2002	The General Food law is responsible for making sure that food is safe to consume and that it can be tracked to where it came from. Since the solution allows people to buy food directly from local producers, it is important that all the food sold meets safety rules. This way customers will receive safe and trustworthy food while proving accountability within the food chain.
Food Information Regulations 2014	Greenfield Local Hub will comply with the Food Information Regulations, this means the solution will provide clear and correct information about all food products. This will include listing all the ingredients, anything that could cause allergies and other important details. The product listings in the solution will show all this information clearly, so customers can make safe and informed choices. This is especially important for customers with allergies or special diets. Greenfield Local Hub will be open and honest and protect customer health by complying with these regulations.
